

MAG-1

Lightweight and highly structured for the fastest races and competitions.

Mag-1 is the boot of choice for most professionals on a mission to combine advanced technology and lightweight design.

The internal exoskeleton in nylon reinforced with fiberglass - extremely lightweight - is certainly one of the most intriguing components of the Mag-1 technology and is dedicated to constant support during riding.

Another important element is the patented closure, which allows for individual adjustment at any time. Made of high-density resin, it is designed to provide a unique fit. The combination with a magnetic hook also allows for quick boot donning, while two screws positioned on the shaft further fine-tune the strap closure.

The sole has been designed to provide the highest level of sensitivity, a crucial detail in racing, and, thanks to the high level of customization and control, results in complete harmony between the motorcycle and the rider.

Flexible and comfortable with an articulation point located on the ankle, Mag-1 ensures excellent protection of the heel - asymmetric and contoured - through a fixed insert equipped with a shock absorption system.

The upper is made of Technomicro, a soft and lightweight microfiber created from ultra-thin threads that mimic natural skin.

Extremely stable and safe, the structure of the Mag-1 has been specially designed to provide maximum support in the event of a fall. This boot offers the rider a suitable surface to support proper gliding. Designed with the aim of offering the best protection combined with maximum lightness. The Mag-1 allows the rider to concentrate on riding.
